PROJECT DOCUMENTATION

Project Overview, Functional Design, User Guide & Testing

Medical Diagnosis Center in ServiceNow

01. Project Overview

This project implements a structured Medical Diagnosis Center lifecycle in ServiceNow, covering patient registration, diagnostic test selection, appointment booking, approval management, laboratory processing, report generation, email notifications, role-based access control, payment/refund support and administrative reporting.

Purpose

The documentation provides a consistent reference for the planned solution, its functional flow, user roles, data relationships, validation activities and deployment-readiness considerations.

Scope

• Patient registration and profile management.

• Diagnostic test catalog.

• Appointment scheduling and validation.

• Approval and laboratory processing.

• Diagnostic report management.

• Email notifications.

• Payment and cancellation/refund support.

• ACL security and patient-specific access.

• Appointments Reports and Health Reports Dashboard.

• Update Set deployment.

Users and Roles

• Patient — register, browse tests, book appointments, view status and access reports.

• Receptionist — manage patient and appointment information.

• Laboratory Technician — process diagnostic tests and support report generation.

• Doctor — review diagnostic information/report data where configured.

• Lab Manager — approve specialized/high-value tests where configured.

• System Administrator — configure tables, portal, widgets, Business Rules, ACLs, notifications, reports, dashboards and Update Sets.

Expected Benefits

• Reduced manual paperwork and duplicate data entry.

• Centralized patient, appointment, test, payment and report records.

• Improved appointment scheduling and laboratory resource utilization.

• Automated approval, notification and report processes.

• Secure role-based access.

• Better operational visibility through reports and dashboards.

Documentation Status

The document is prepared as the project documentation for Medical Diagnosis Center in ServiceNow. Final screenshots and execution evidence can be attached from the implemented instance.

02. Functional Design Document

Functional Flow

> Patient Registration → Diagnostic Test Selection → Appointment Booking → Validation → Pending Approval → Confirmed → Sample Collected → Processing → Completed → Report Generated → Report Available. Cancellation is an alternative lifecycle outcome and can trigger the configured refund calculation.

Diagnostic Test / Appointment Classification

- Diagnostic Test
- Appointment Date
- Time Slot
- Approval Status
- Appointment Status
- Patient
- Payment Status
- Report Status

Validation Checklist

- Patient record is complete.
- Diagnostic test is active and correct.
- Appointment date/time is available.
- Approval/status values are correct.
- Laboratory processing is traceable.
- Report is linked to the correct patient and appointment.
- Notifications trigger as configured.
- Payment/refund values are correct.
- ACL security is verified.
- Dashboard/report data is visible.

03. User Guide

Patient

- Open the Medical Diagnosis Center Service Portal.
- Browse the Test Catalog.
- Enter patient details and select a diagnostic test.
- Select appointment date and time slot.
- Submit and check My Appointments.
- Track approval and appointment status.
- Open Lab Reports when the report becomes available.

Receptionist

- Create/update patient records.
- Review appointment information and coordinate bookings.
- Support configured cancellation/rescheduling.

Laboratory Technician

• Review approved appointments.

• Collect sample and update processing status.

• Complete diagnostic processing and support report generation.

Doctor

• Review diagnostic information/report data where configured.

Lab Manager

• Review specialized/high-value appointments.

• Approve/reject appointments where configured.

• Monitor operational status.

System Administrator

• Configure tables, forms and fields.

• Develop Service Portal pages and widgets.

• Create Business Rules and Flow Designer workflows.

• Configure ACLs and notifications.

• Create reports and dashboards.

• Manage Update Sets and application deployment.

Important Note

The exact navigation labels, field values and UI behavior depend on the final ServiceNow configuration. Screenshots should be inserted from the implemented instance for final submission.

04. Testing and Deployment Validation

Functional Validation

• Validate Patient and Diagnostic Test configuration.

• Validate appointment creation and mandatory information.

• Validate date/time, capacity and duplicate/overlap controls.

• Validate approval and appointment lifecycle.

• Validate laboratory processing and report creation.

• Validate report access restrictions.

• Validate notifications.

• Validate cancellation and 10% refund calculation.

• Validate ACL security.

• Validate dashboard and appointment reporting.

End-to-End Test Scenario

> Create patient → select diagnostic test → book appointment → validate slot → approve → collect sample → process → complete → generate report → notify patient → verify report access. If cancelled, verify cancellation and configured refund.

Deployment Readiness

• All planned functional tests completed.

• No unresolved critical defects.

• Patient, appointment, test, report and payment relationships verified.

- ACL and notification validation completed.
- User acceptance evidence captured.
- Update Set deployment validation completed.

Status

Execution results are not asserted because the supplied Medical Diagnosis Center source materials do not provide actual execution measurements for every test scenario. Final screenshots/evidence should be added from the implemented instance.
